GEOMETRY VOCABULARY

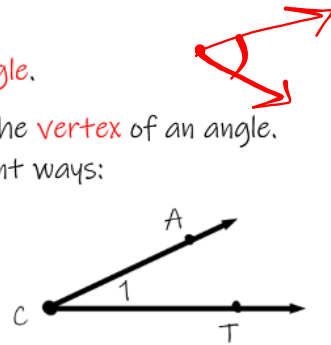

Important Symbols:

\angle angle	"m" measure	parallel to	\perp perpendicular to
----------------	-------------	-------------	--------------------------

1. Two Rays sharing the same initial point form an **angle**.

- The initial point where the rays meet is called the **vertex** of an angle.
- We can name the angle shown right four different ways:

- $\angle ACT$
- $\angle TCA$
- $\angle C$
- $\angle 1$

- Name the two rays: \overrightarrow{CA} and \overrightarrow{CT} .
- If multiple angles share a common vertex, we must use three letters or the number label to name the angle.

2. An angle with a measure that is less than 90° is called an **acute** angle.

3. An angle with a measure greater than 90° is called an **obtuse** angle.

4. An angle with that measures exactly 180° is called a **straight** angle or a **line**.

5. An angle that measures exactly 90° is called a **right** angle.

6. Label each of the following by the vocab word that describes the size of the angle.

a.

b.

c.

d.

7. Two lines that intersect to form a right angle are called **perpendicular** lines.

- The symbol \perp indicates that one line is perpendicular to another.

8. Two angles that share a common vertex and a common ray are called **adjacent** angles.

- The sum of angles 1 and 2 is 96 degrees. If angle 1 is 58 degrees, what is the measure of angle 2? $96 - 58 = \boxed{38^\circ}$

9. When the noncommon sides of **two adjacent angles** form a straight **line**, they are called a **Linear Pair**

- The sum of the two angles of a linear pair is 180° .
- When two angles have a sum of 180° they are also called **supplementary**. **Supp**
- We can use the equation **angle + angle = 180** to solve problems when angles are **supplementary**.

Solve for x:

a. $102 + x = 180$
 $x = \boxed{78}$

b. $126 + x - 9 = 180$
 $117 + x = 180$
 $x = \boxed{63}$

10. When two lines intersect, four angles are formed.

- The adjacent angles form **Linear Pairs** and their sum is 180° .
- The non-adjacent angles are called **Vertical angles**. **Vertical** angles are always congruent.
- For Vertical angles we can use the equation **angle = angle** to solve.
 - If the measure of angle 1 is 54 degrees, and the measure of angle 3 can be expressed as $(12x + 6)$, solve for x.

$12x + 6 = 54$
 $12x = 48$
 $x = \boxed{4}$

a. Determine the measure of $\angle a$ and $\angle b$

$a = \boxed{74}$
 $b = \boxed{106}$

b. Solve for x and y.

$7x + 5 = 96$
 $7x = 91$
 $x = \boxed{13}$
 $10y + 14 = 84$
 $10y = 70$
 $y = \boxed{7}$

11. When the sum of two angles is 90° we say that they are **complementary**. We can use the equation **angle + angle = 90** to solve.

12. When a ray cuts an angle exactly in half it is called an **angle bisector**.

- This creates two equal pieces.

a. $\angle DOG$ is 98 degrees. \overline{OT} is an angle bisector. Find the measure of $\angle a$ and $\angle b$.

$a = 49$
 $b = 49$

b. \overline{AB} is an angle bisector. Solve for x.

$12x-8=10x+10$
 $2x=18$
 $x=9$

13. Naming sides of polygons

- The sides of polygons are formed by line segments. To name a side, we use two letters with a bar over them.

A. Name the left side of the triangle.

\overline{AB}

B. Name the top side of the rectangle.

\overline{AB}

Angles Practice Page

Name the relationship between angle a and angle b .

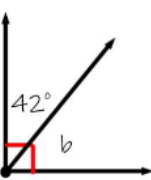

1. 

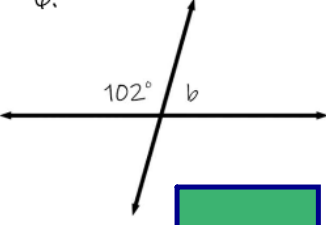

2. 

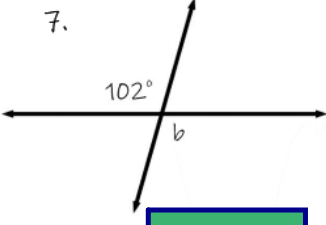

3. 

4. 

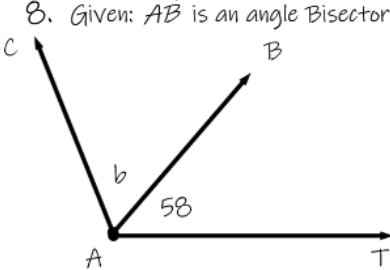

Find the measure of angle b in each diagram.

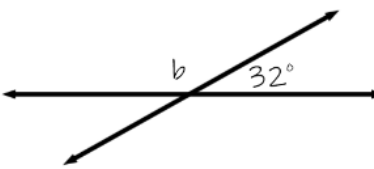

5. 

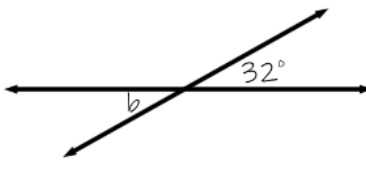

6. 

7. 

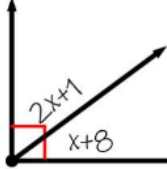

8. Given: \overline{AB} is an angle Bisector

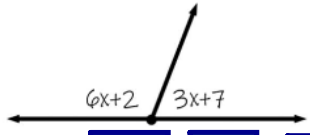

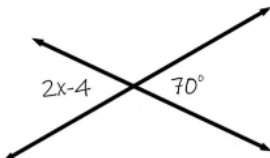

9. 

10. 

9. Solve for x .

a. 

b. 

c. 

10. Answer the questions using the diagram to the right.

a. Name the two pairs of vertical angles:

b. Name 4 linear pairs:

c. If the measure of angle 1 is 107, what is the measure of angle 2?

d. If the measure of angle 1 is 107, which other angle must also be 107?

Word Problems:

11. Two angles are complementary. The first angle is 5 times the measure of the second angle. Find both angles.

=
 =

12. Two angles are supplementary. The first angle is 9 less than 2 times the second angle. Find both angles.

+ =
 =

13. Two angles are supplementary. One angle is 2/3 the measure of the other one. Find both angles.

14. Two angles are complementary. One angle is 9 more than twice the other angle. Find both angles.

+ =
 =

15. CHALLENGE SECTION: Find the measure of all the numbered angles below.

- $\angle 1 =$ $\angle 2 =$
- $\angle 3 =$ $\angle 4 =$
- $\angle 5 =$ $\angle 6 =$
- $\angle 7 =$ $\angle 8 =$
- $\angle 9 =$ $\angle 10 =$
