

## Rules for Class Sessions

1. You must use your first AND last name as a participant.
2. Once logged in, type "here" in the chat for attendance.
3. Raise your hand for a question.
4. Respect others.

Alt. Int.  
∠s

$$m\angle 1 + m\angle 2 + m\angle 3 = 180$$
$$m\angle 4 + m\angle 2 + m\angle 7 = 180$$

# All About Triangles

## 1. Triangle Sum Theorem:

The sum of the three interior angles of a triangle is  $180^\circ$ .

Examples: Find the missing angle in each triangle below.

a.  $33 + 65 + x = 180$     b.  $37 + 88 + x = 180$

$x + 42 + 90 = 180$   
 $x + 42 = 90$

2. Challenge: Use the properties we have learned about angle relationships to find the missing angles in the diagrams.

$x = 41$

$y = 45$      $z = 81$

$z + y + 54 = 180$

$81 + y + 54 = 180$

$54 + 85 + x = 180$

$139 + x = 180$

outside

3. The Exterior Angle Theorem: If you extend the side lengths of a triangle beyond its vertices, exterior angles are created.

- The sum of the two non-adjacent angles in the triangle will be equal to the exterior angle.

$49 + 86 = \text{Exterior}$

$135 = \text{Exterior}$

The non-adjacent angles are called the remote angles.

Equation:  $\text{remote angle} + \text{remote angle} = \text{exterior angle}$

Examples: Solve for x.

a.  $7x + 4 + 58 = 16x + 8$

$7x + 62 = 16x + 8$

$54 = 9x$

$x = 6$

$x = 6$

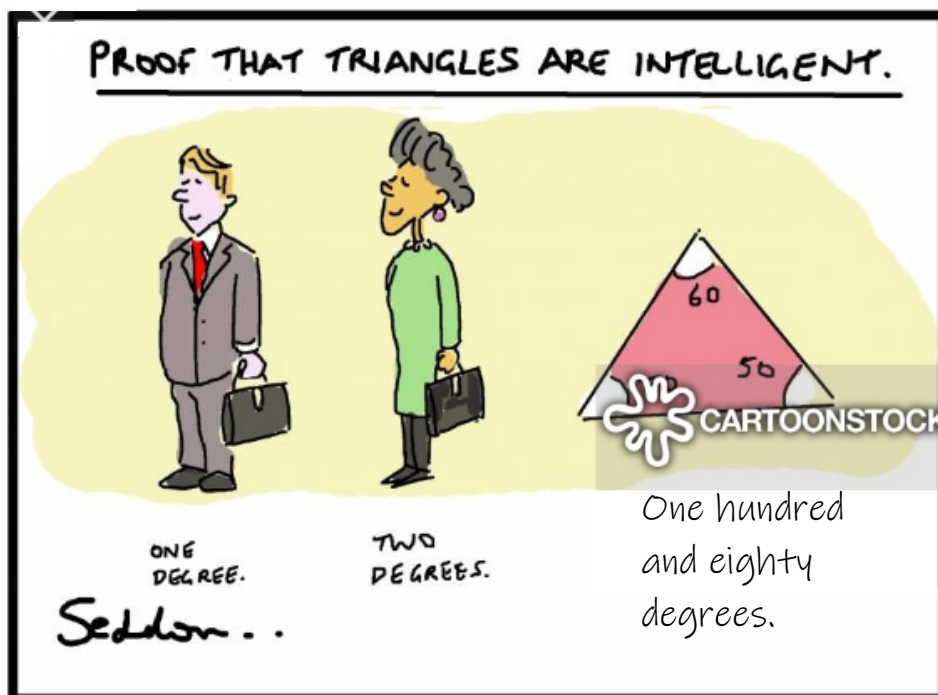

b.  $7x + 47 = 17x - 3$

$50 = 10x$

$x = 5$

$x = 5$

$$m\angle B + m\angle E = 180$$

$$m\angle G + m\angle A + m\angle B = 180$$

$$m\angle B + m\angle E = m\angle G + m\angle A + m\angle B$$

~~$-m\angle B$~~

~~$-m\angle B$~~

---

$$m\angle E = m\angle G + m\angle A$$

4. Classifying Triangles

By their Sides:

a. Three Congruent sides:

b. Two Congruent Sides

c. No Congruent Sides

By their angles

d. All Acute angles

e. One obtuse angle

f. One right angle

5. An **Equilateral** triangle will also be **Equiangular** meaning that all three angles will be congruent too.

- If all angles add be 180, and they are all the same...what would the measure of each angle have to be?  
 $x + x + x = 180$   
 $3x = 180$   
 $x = 60$
- This will always be true. Each angle in an equilateral triangle will always be **60 degrees**.

6. The Base Angles Theorem

In an **Isosceles** triangle, the two congruent sides are called the **legs** of the triangle, and the third side is called the **base**.

The two angles on the base are called the **base angles** and they are **always congruent**. They are the angles opposite the congruent sides.

The third angle is called the vertex angle.

If you know two angles are congruent, that proves the sides opposite the angles are **congruent**.

If you know that the sides are congruent, that proves that the angles opposite them are **congruent**.

Examples: Solve for x and y.

$x=84, y=48$

$x=5$

$x=62, y=62$

$x=3$

e. Challenge Section!

$w=32, x=32, y=116$

$z=116, t=148, u=32$

$r=148$

$180 - 32 - 32 = 116$

$r = 116 + 32 = 148$

$180 - 32 = 148$

This triangle  
is not possible!  
Collinear  
& same "line"

7. The Triangle inequality Theorem

- The sum of any two sides of a triangle **must be greater than the** length of the **third** side.
- The largest angle is opposite of the **longest side**, and the smallest angle is opposite the **shortest side**.

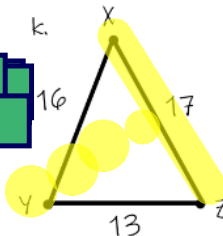

State if the Three numbers can be the side lengths of a triangle.

a. 10,7,20 NO! $10 + 7 = 17$ $17 < 20$	b. 3,6,9 NO! $3 + 6 = 9$ $9 = 9$ 9 is not greater than 9.	c. 3,4,5 <del>NO!</del> $3 + 4 = 7; 7 > 5$ $3 + 5 = 8; 8 > 4$ $4 + 5 = 9; 9 > 3$ YES! Handwritten: $3 + 4 = 7$ $4 - 3 = 1$ $1 < x < 7$
d. 7,10,3 NO! $7 + 3 = 10; 10 = 10$ 10 is not greater than 10	e. 12,18,7 $12 + 18 = 30; 30 > 7$ $12 + 7 = 19; 19 > 18$ $18 + 7 = 25; 25 > 12$ YES!	f. 8,15,17 $8 + 15 = 23; 23 > 17$ $8 + 17 = 25; 25 > 15$ $15 + 17 = 32; 32 > 8$ YES!

Two sides of a triangle have the following measures. Find the Range of possible measures of the third side.

g. 9,9 $9 + 9 = 18$ $9 - 9 = 0$ $0 < x < 18$	h. 10,7 $10 + 7 = 17$ $10 - 7 = 3$ $3 < x < 17$
i. 10,9 $10 + 9 = 19$ $10 - 9 = 1$ $1 < x < 19$	j. 8,12 $12 + 8 = 20$ $12 - 8 = 4$ $4 < x < 20$

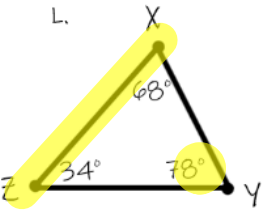

For each triangle below, if the **sides** are given: state which angle is the largest one, and which angle is the smallest one. IF the **angles** are given, state which side is the longest, and which side is the shortest.

k. 

Largest:  $\angle Z$

---

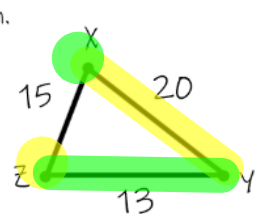

Smallest:  $\angle X$

l. 

Longest:  $\overline{XZ}$

---

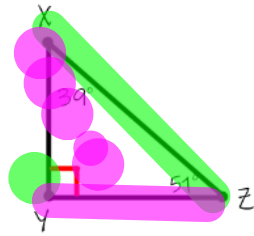

Shortest:  $\overline{XY}$

m. 

Largest:  $\angle Z$

---

Smallest:  $\angle Y$

n. 

Longest:  $\overline{XZ}$

---

Shortest:  $\overline{YZ}$

$10, 7, X$

$3 < X < 17$

$10 + 7 > X$

Add  $17 > X$

---

Subtract

ex. 15

ex. 2

$10 + 7 = 17$

$7 + 2 = 9$

$17 > 2 \checkmark$

~~$9 > 10$~~

ex. 3.5

~~$7 + 3.5 = 10.5$~~

$\checkmark 10.5 > 10$

$X > 3$

$$5 + 2 = 7$$
$$7 < 10$$

$$5 + 5 = 10$$
$$10 = 10$$

$$5 + 6 = 11$$
$$11 > 10 \quad \checkmark$$
